

Demand Control Ventilation

Change the current way you use energy and make your bill even lower.

Get fresh air with Demand Control Ventilation

Save energy by adjusting your building's ventilation

Keeping people healthy and emissions low is important to everyone, and a Demand Control Ventilation (DCV) system helps with both. It also helps lower your energy use and bill. Install a qualifying DCV system that automatically adjusts your building's ventilation; we'll help you pay for your new system.

A DCV sensor (on the right) can easily be added to your existing Heating Ventilation Air-Conditioning (HVAC) system and is typically located next to a thermostat.

Demand Control Ventilation (DCV)

A DCV system uses sensors to automatically adjust the amount of fresh air that is taken into your building by your air-conditioning equipment. With DCV, your building's ventilation is based on actual occupancy at any given time — saving you money on your electric bills, decreasing your maintenance costs and extending the life of your system.

Benefits

- » Reduces air-conditioning energy use by 10 to 25 percent per year
- » Lowers maintenance costs on your air-conditioning system
- » Improves indoor air quality
- » Reduces carbon emissions since your air-conditioning system works less
- » May extend the life of your air-conditioning system

DCV System at Partial Occupancy
